Overview & External Testing Brief · Oct 1, 2026 · @benji107

HANDSHAKEOTC.FYI · BLOCKDAG CHAIN 1404

Handshake: overview & testing brief

Handshake is a live peer-to-peer OTC escrow on BlockDAG (chain 1404): swap BDAG for any ERC-20 with anyone, **in one atomic transaction**, with the escrow held by code rather than by a person. It is open to everyone as a **clearly labelled, unaudited beta**.

What Handshake is

Handshake is a **peer-to-peer OTC desk** for trading native BDAG against any ERC-20 token on BlockDAG, without an order book, pooled liquidity or a middleman. A maker locks BDAG or a token in an offer and names the price; anyone (or one specific address the maker chooses) can fill it. Both sides change hands in **one atomic transaction**, so either the whole trade settles or nothing moves. The maker can cancel an unfilled offer at any time and get their asset straight back.

Custody, plainly: while an offer is open, the maker's asset is held by the smart contract, not by us or any other person. Only two things can happen to it: it goes to the taker on fill, or back to the maker on cancel. The site is live at handshakeotc.fyi.

What it can do today

Fee: 0.25%, taken from the BDAG side of each filled trade and hard-capped in the contract at 3%. Each offer records the fee when it is created, so a later change never affects an open offer. The fee can only be changed by a **2-of-2 hardware-wallet multisig**.

Feature	What it does
Create an offer	Give BDAG for a token, or a token for BDAG, at the price you set
Private offers	Optionally restrict an offer so only one named address can fill it
Fill an offer	Take any open offer; both assets swap in one transaction
Cancel any time	The maker gets the full locked asset back while the offer is unfilled
My offers & recent fills	Your own open offers, plus a live feed of completed trades read from the chain
Token check	Confirms a token address is a real contract and shows its symbol before you trade
Safety checks before signing	Balance, per-offer beta limit and pause state are checked first, so you get a clear message instead of a failed transaction
Exact approvals	Tokens are approved for exactly the amount in the offer, never an unlimited allowance

Feature	What it does
Security & trust section	States what the owner can and can't do, with links to the verified contract and source
RPC status panel	Nine community BlockDAG endpoints checked live from your browser, with automatic failover

Contracts & settings

Solidity 0.8.24 · no imports · no upgrade mechanism · EVM Berlin

OTCEscrow (live)	v3 with pause and per-offer limits 0xD907701A2D96f7D0E7596b02737C9F36446cf5CA · verified on explorer.bdagexplorer.com
OTCEscrow (original)	Paused 0x3A8716b7260D2F808250d37F4534Ebe22b6C4b8a · never had an offer, holds nothing
Owner	2-of-2 multisig (Trezor + Ledger) 0x4E2401bFD24c66166fABF9Cc5cD5B6B2c5c860fc · since block 22,975,549
Fee recipient	Project wallet 0x26bDba7b184df8b88965Bed46AE60fF940
Beta limits	100 BDAG · 1,000,000 NOCAP maximum a maker can lock per offer; other tokens uncapped
Owner powers	Fee (≤3%), recipient, limits, pause new offers all need both hardware wallets; no function can move an open offer's assets

Security and testing

A thorough in-house review; no independent professional audit.

Check	Result
Earlier code reviews (v2, v3)	Closed a critical hole where an offer using an address with no contract could let a taker take the maker's BDAG without paying; added a balance check that rejects fee-on-transfer tokens instead of trapping funds; fees locked per offer
Static analysis (Slither)	6 findings in the original contract all resolved (2 real fixes, 1 reviewed as intended, 3 false positives); 0 findings on the live contract with 4 detectors excluded, each documented as a false positive in the source
Live test suite	8/8: native and token offer creation with the new limits, pause alongside limits, and both v3 security fixes still intact
Deployed code check	Both contracts' on-chain code matches the published source (optimizer 200, Berlin); the live contract is verified on the explorer
Front-end / contract match	Every function and event the site uses matches the deployed contract
Found and fixed	A helper function called but never defined; event definitions on the site that didn't match the contract; the repo held an outdated v2 source (v3 sources now published)
Wording and layout	"Non-custodial" replaced with accurate custody wording; sideways scrolling on phones fixed
Migration	Original contract paused before switching; ownership moved to the multisig; beta limits set
Vulnerability reports	Private address set up and tested: security@handshakeotc.fyi

Not done yet:

- Independent audit by a professional security firm
- A bug-bounty programme

Readiness

Now: public beta

Handshake is live on BlockDAG mainnet and open to everyone as a **clearly labelled, unaudited beta**, with per-offer limits in place. The beta banner, the terms before first use, the FAQ and the Security & trust section all say so.

Why it is reasonable to use

- Nobody, including the owner, can move an open offer's assets
- Trades are atomic: there is no delivery step to dispute
- Pausing can't trap anyone; fills and cancels always work

What remains a risk

- No professional audit; a bug could still cost users money
- Any token can be offered, including fake ones
- A young chain with occasionally unreliable RPCs

For testers

What to test

Use small amounts only, on chain 1404, with MetaMask or a similar wallet, at handshakeotc.fyi. Two wallets help.

- 1 **Offer BDAG for a token:** create a small offer, check it under My offers, then cancel and confirm the refund.
- 2 **Fill it:** from a second wallet, fill a small offer and check both sides and the 0.25% fee on the explorer.
- 3 **Offer a token for BDAG:** expect an exact-amount approval, then the offer.
- 4 **Private offer and limits:** restrict an offer to one address; try 150 BDAG (should be blocked).
- 5 **Phone and desktop:** use the site on both; check the RPC panel.

How to report

Include what you did, what you expected, what happened, your wallet and browser, a screenshot, and the transaction hash if there is one.

Anything that could lose funds: email security@handshakeotc.fyi privately, never in public, so it can be fixed or new offers paused first.

Everything else (bugs, wrong numbers, confusing wording): send it to the team, or open an issue on the project's GitHub.

As in the terms, testers must not be located in or residents of the US or UK.

Known limitations. Handshake accepts any ERC-20 and doesn't vet tokens: a fake or malicious token can be offered, so always check the contract address. Fee-on-transfer and rebasing tokens are refused by design. Offers fill whole, not in parts. Public RPC endpoints sometimes lag or go offline. Token approvals are for the exact amount, so you approve again for each offer.

Roadmap

Each stage unlocks the next.

- 1 **Public beta** (now). Live trading with per-offer limits; feedback gathered and fixed.
- 2 **Track record.** Raise or add per-token limits as usage grows, each change made through the multisig.
- 3 **Security hardening.** Independent audit with the report published; a bug-bounty programme alongside the security@ address.
- 4 **Growth.** Invite token projects to use Handshake for OTC deals, and list it in community directories under its own domain.

Open question for the team: target date and budget for the independent audit.

Handshake OTC Escrow on BlockDAG chain 1404. Nothing here is financial, legal or tax advice.
